

NovaTech Revenue Intelligence Project Report

Prepared by Yayson Valencia | September 14 2026

Executive Summary

The NovaTech Revenue Intelligence solution integrates sales, marketing, and support data into a three-sheet Amazon Quick dashboard. The completed dashboard supports funnel analysis, sales performance monitoring, and customer-health review. Source-level measures remain authoritative for domain totals, while the unified CRM-anchored dataset supports cross-domain relationships using distinct identifiers. Topic enrichment materially improved natural-language accuracy by exposing required fields, adding business descriptions and synonyms, defining named filters, and separating CRM Won outcomes from Marketing Closed Won stages.

Data Preparation and Validation

Six pre-import checks were completed against the provided data dictionaries. All checks passed. The three source files were imported to SPICE, field types were reviewed, and business calculations were added before publication.

Dataset	Source rows	Prepared columns	Calculated field	SPICE result
CRM deals	499	21	Days To Close	100 percent
Marketing campaigns	2,240	21	Campaign ROI	100 percent
Support tickets	3,000	21	Resolution Hours	100 percent
Unified revenue	63,420	63	Source calculations retained	100 percent

CRM was used as the unified dataset anchor. Marketing and Support were left-joined on account_id. Because each source contains multiple records per account, the join creates many-to-many fan-out. The unified dataset is therefore appropriate for matched-account relationships and distinct identifier counts, but not for additive sales, spend, or revenue totals.

Dashboard Design

Sheet	Primary measures	Analysis purpose
Marketing Funnel	2.24K leads; 27.19 percent response; 12.36M dollars spend; 1.13M dollars attributed revenue	Compare funnel volume, channel response, campaign economics, and ROI.
Sales Pipeline	707,201 dollars deal value; 499 opportunities; 66.8 average days to close	Review Won and Lost outcomes, regional deal value, and monthly close trends.
Customer Health	2,792 matched tickets; 59.6 average resolution hours	Assess sentiment, ticket priority, and resolution time by customer tier.

Sheet-level controls were configured for campaign attributes, Sales Region, and Customer Tier. A one-click deal-outcome action updates all Sales Pipeline KPIs. A navigation action connects the regional sales chart to Customer Health. Three dashboard annotations state a finding, implication, and action. The dashboard was published and exported as a verified three-page PDF.

Topic Configuration and Accuracy Improvement

The NovaTech Revenue Intelligence Topic includes the unified dataset plus the authoritative CRM, Marketing, and Support sources. Key fields received business definitions, alternate names, default aggregations, formats, and inclusion settings. Named filters were created for Won Opportunities, Critical Support Tickets, and Responded Campaign Records. Custom instructions route single-domain totals to source datasets and reserve the unified dataset for explicit cross-domain questions.

Question	Before enrichment	After enrichment	Assessment
Distinct opportunities Won versus Lost	315 Won and 184 Lost in baseline chat; initial Topic misread the request as 412 Marketing leads.	315 Won and 184 Lost using distinct Opportunity Id by Deal Stage.	Field inclusion and CRM semantic mapping corrected dataset selection.
Average campaign response rate by channel	Unified join returned 62.05, 49.44, 28.01, 7.32, and 1.37 percent.	53.02, 40.31, 34.32, 14.46, and 8.68 percent; 27.19 percent overall.	A dedicated numeric response-rate metric removed Boolean-filter ambiguity and fan-out bias.
Distinct support tickets by priority	Unified match returned 1,411 Low, 971 Medium, 368 High, and 46 Critical.	1,500 Low, 1,050 Medium, 400 High, and 50 Critical from Support.	Support field inclusion restored authoritative source coverage.

Exploration Log

Domain	Question	Result
Sales	Average Days To Close by Sales Region	West 70.09; Central 66.51; East 62.87 days.
Marketing	Average Campaign ROI by Campaign Name	NovaPulse leads at -81.18 percent; overall ROI is -90.34 percent.
Support	Average Resolution Hours by Customer Sentiment	Neutral 58.96; Positive 58.48; Negative 56.33; missing 53.56 hours.
Support filter	Average Resolution Hours for Critical Support Tickets by Customer Tier	Enterprise 61.59; Plus 49.11; Basic 24.00; overall 56.13 hours.
Cross-domain	Distinct Opportunity Id and Ticket Id by Customer Tier	Matched universe contains 496 opportunities and 2,792 tickets across three tiers.

Findings and Recommended Actions

- Marketing efficiency requires intervention. Attributed revenue is materially below recorded campaign spend across all six campaigns. NovaPulse Launch has the least-negative average ROI at -81.18 percent, while NovaEdge Awareness is lowest at -97.75 percent. Validate attribution logic and spend allocation before increasing campaign budgets.
- Sales outcomes are comparatively strong. CRM contains 315 Won and 184 Lost opportunities, a 63.1 percent win rate. West has the longest average sales cycle at 70.09 days, compared with 62.87 days in East. Review West-stage handoffs and replicate faster East practices where process conditions are comparable.
- Support performance varies by segment. Critical Enterprise tickets average 61.59 resolution hours, versus 24.00 for Basic. Prioritize root-cause analysis for complex Enterprise incidents and monitor whether ticket complexity, escalation paths, or staffing explain the gap.

Limitations

The unified dataset excludes orphan account IDs because CRM is the left-side anchor. It also duplicates records through many-to-many joins. Per-tier distinct counts can overlap when joined records associate identifiers with multiple tier values. Causal claims are not supported: the dashboard identifies patterns, not the reasons those patterns occurred. Marketing ROI depends on the supplied attribution and spend definitions and should be validated before operational decisions.

Conclusion

The project meets the required technical scope: verified source data, SPICE imports, calculated business fields, a documented unified dataset, three interactive dashboard sheets, filtering and navigation actions, publication, PDF export, an enriched Topic, repeated baseline tests, and cross-domain exploration. The central control is source discipline: use authoritative source datasets for totals and the unified dataset only for relationship analysis with distinct identifiers.
